1. The Problem

In many organizations, employees lack a formal and transparent way to report office-related concerns. Complaints shared through verbal communication or scattered emails are often ignored, lost, or left unresolved. Without a structured system, employees cannot track the status of their grievances, and management has no clear way to measure how many issues remain open versus how many have been settled.

2. The Solution

This project introduces a digital **Grievance Registry** that organizes workplace problem-solving into a clear, role-based workflow. The system categorizes users into three roles: **Administrators**, **Employees (Users)**, and **Grievance Managers**. By centralizing all complaints in a secure database, the system ensures that every concern is documented, assigned to a manager, and tracked in real-time until it is marked as "Resolved."

3. Modules & Functional Requirements

- **Administration & Login:** Provides secure authentication and "User-Service-Role Mapping". This ensures that only Admins can manage users and that Employees and Managers see only the menus relevant to them.
- **Grievance Registry:** A module that allows Employees to "raise concerns" about the office by submitting a formal complaint with a title and description.
- **Grievance Forum & Search:** A searchable interface where users can find specific grievances and monitor their current status (e.g., Open, In Progress, or Resolved).
- **Resolution & Reporting:** A dedicated area for Grievance Managers to resolve complaints. The system generates reports on "Resolved vs. Open" status to ensure full accountability.
